Rubber Hose - Industrial

Rubber Jacketed Hose

A jacketed assembly consists of a “hose within a hose.” An inner or primary media conveying hose is enclosed or jacketed by a larger diameter hose. The hoses are joined at each end by specially designed fittings so that there is no media pathway between the two hoses.

Jacketed assemblies are often specified when the primary media must be kept at either an elevated or cryogenic temperature. Steam is often circulated through the jacket hose to keep a viscous material in the inner hose hot and easily conveyed. A vacuum can also be pulled on the jacket hose to insulate cryogenic liquids being conveyed in the inner hose.

The media typically is steam, hot oil or hot water to raise the temperature of the fluid moved in the internal hose. Also cold products such as liquid helium or nitrogen can be used to lower the temperature of the fluid with-in the internal hose.

The specialist hose design can also be used to contain hazardous and chemical mediums in the event of a rupture. The outer hose will capture any medium that leaks from the inner hose preventing any safety or environmental issues. Sensors can be installed on the ports of the outer hoses to analyse any changes in pressure or gas detection.

Following Applications:

- Rail car and tank truck loading/unloading
- Marine Transfer
- Flexible connections to vibrating equipment
- To relieve pump housing stresses
- Hazardous material piping system using an alarmed vacuum jacket
- Safety barrier for toxic processes
- Leak detection systems
- Liquefied food transfer systems

Applications

Composite Hose Design

Introduction

Composite hoses are made from quality materials. The inner films and fabrics provide optimum chemical resistance. Protected with the PVC impregnated outer covers, composite hoses provide the strength and versatility for all petrol and chemical applications.

Composite Hoses are designed to meet the most demanding transfer applications such as:

- Hydrocarbon
- Chemical
- Cryogenic

Composite hoses are reinforced offering strength, light weight, flexibility and versatility for variations in pressure, temperature and product conveyance compatibility. Composite Hose meets various Australian & International Standards and is available in sizes from 25mm – 250mm.

Application

Transfer for road and rail tanker loading and discharging, storage tank and in-plant use
 Conveyants – petrol, diesel, kerosene, black oils, tallow and heavy lubricating products
 Ship-to-shore and ship-to-ship transfers, dock side and general shipboard use.

Rope Lagging

All hoses can be supplied with rope lagging. It is necessary to specify at time of ordering. Polypropylene rope is used as lagging. Lagging insulates and protects the hose from abrasion and heat transfer.

Nominal Dia.		Rope Diameter	Weight
mm	inches	mm	Kg/M
25	1	8	0.48
32	1 1/4	8	0.65
39	1 1/2	8	0.70
51	2	8	0.80
63	2 1/2	10	1.25
76	3	10	1.50
102	4	10	2.00
152	6	12	2.90

Composite Hose Design

Hose Assemblies

Due to the often hazardous conveyance used it is recommended that composite hose should only be used with properly fixed fittings. Composite hoses are normally fitted by the wire whipped method or by external crimp. All hoses have a 6 to 1 safety factor.

Testing

All hose assemblies must be pressure tested hydrostatically to one and a half times the maximum recommended working pressure and electrically tested to confirm continuity per:

- AS2683, AS2594, AS1180, AS2117
- BSEN13765:2010, BS5842:1980
- EN13766:2010, EN ISO 8031:2009, EN ISO 1402

Fittings

A wide range of fittings can be supplied such as Camlocks, Screwed fittings, flanges etc. Material fittings - Stainless Steel, Aluminum, Custom.

Construction

Use:

FIRESAFE composite hose utilizes a series of non asbestos barriers to conduct and radiate heat to achieve outstanding fire retardant ability. Rigorous testing by an independent agency has proven FIRESAFE hose still intact and capable of holding product after thirty (30) minutes of severe fire attack. The internal versus external temperature during this test showed an extremely low heat transfer rate maintaining an internal temperature of below 200 degrees Celsius with an external temperature over 800 degrees Celsius. Even after loss of integrity, FIRESAFE hose will not fail catastrophically.

These characteristics coupled with better torque resistance and abrasion resistance compared to metallic flexible hose, make this a viable alternative for bottom loading/ drop hoses.

Composite Hose - Industrial

Composite Jacketed Hose

A jacketed assembly consists of a “hose within a hose.” An inner or primary media conveying hose is enclosed or jacketed by a larger diameter hose. The hoses are joined at each end by specially designed fittings so that there is no media pathway between the two hoses.

Jacketed assemblies are often specified when the primary media must be kept at either an elevated or cryogenic temperature. Steam is often circulated through the jacket hose to keep a viscous material in the inner hose hot and easily conveyed. A vacuum can also be pulled on the jacket hose to insulate cryogenic liquids being conveyed in the inner hose.

The media typically is steam, hot oil or hot water to raise the temperature of the fluid moved in the internal hose. Also cold products such as liquid helium or nitrogen can be used to lower the temperature of the fluid with-in the internal hose.

The specialist hose design can also be used to contain hazardous and chemical mediums in the event of a rupture. The outer hose will capture any medium that leaks from the inner hose preventing any safety or environmental issues. Sensors can be installed on the ports of the outer hoses to analyse any changes in pressure or gas detection.

Following Applications:

- Rail car and tank truck loading/unloading
- Marine Transfer
- Flexible connections to vibrating equipment
- To relieve pump housing stresses
- Hazardous material piping system using an alarmed vacuum jacket
- Safety barrier for toxic processes
- Leak detection systems
- Liquefied food transfer systems
