Stainless Steel Hose Design

Introduction

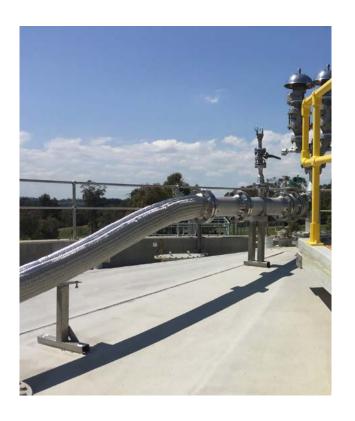

The VITALFLEX® range is especially designed to achieve several objectives in pipe work design. These include, absorption or vibration, operate under vacuum, handle temperature extremes, suppress rigid pipe noise transmitted, accommodate reciprocating and flexing movement, operate effectively under high pressures and adjust or correct for misalignment.

VITALFLEX® hose is a general purpose industrial hose and is available in different grades of stainless steel including 304, 316, 321, Monel, C276 & Inconel.

Convoluted Hose Design

The corrugated hose is manufactured from a cylindrical, thin walled tube formed from rolled strip and welded at the seam. Impressed into this tube is a corrugated annular profile. Annular corrugation means each convolution is perpendicular to the centre line of the hose giving a distinct advantage of movement with each corrugation being relatively independent of movement from each other. When the corrugations are closely spaced, the hose is referred to as 'closed pitch' hose. Conversely, when the corrugations are more widely spaced, the hose is referred to as 'open pitch'.

Metallic - Excellence in liquid and gas transfer applications

Temperature

Contingent upon the extremes of temperature; hot or cold metal is a positive choice as it can withstand temperature extremes.

Chemicals

Metal hose is an excellent option as it effectively controls exposure to a wide range of chemicals - both internal and external.

Permeation

Metal hose is not subject to permeation whereas non metal hose can allow permeation through the hose wall material. Pacific Hoseflex has Australian Gas Approved (AGA) certified hose to assure customers of compliance.

Failure

Generally speaking, metal hoses do not disintegrate rapidly causing any major failure. Warning signs are evident that leaks are present and the medium escapes gradually. Nonmetallic hoses can be prone to sudden failure.

External Abrasion and Over bending

A range of options exist to prevent these occurrences; including external braid, spring guards, rubber and PVC covers and protective sleeves.

Heat and fire

Our metal hoses maintain form and structure up to 700°C. Activfire Certified.

Fittings / Flanges

We can adapt virtually any fittings and flanges to a metal hose other hose products require special and significant variances. We specialize in providing flexible options. Certified Welding methods:

- AS4041 Class 1
- ASME B31.3
- ASME IX
- AS/NZS 3992
- ASME BPVC.IX & AS 1554.1 SP

Stainless Steel Hose Vacuum

The VITALFLEX® hose in externally pressurized system (under vacuum).

When a corrugated metal hose is considered to be used in a system which is externally pressurized or under vacuum conditions (i.e. vacuum pumps), the question as to how the hose will behave under "full vacuum" or "perfect vacuum" is often asked.

The definition of vacuum is used to describe any pressure that is lower than standard atmospheric pressure. The most widely accepted unit of vacuum measurement is the Torr (after an Italian scientist Torricelli). So one standard atmospheric pressure can be expressed (in the units more commonly used within our community) as the following: 1 atmosphere = 760 Torr = 14.7 PSI

According to Columbia Encyclopedia: "a perfect vacuum has never been obtained.." and therefore expressions "full vacuum" or "perfect vacuum" are used loosely to express conditions with near "0" pressure. Take a look at the table below to compare different "vacuum conditions":

	Pressure (Torr)	Pressure (PSI)
Vacuum Cleaner	600	11.60
Liquid Ring Vacuum Pump	24	0.46
Rotary Vane Pump	1 to 0.01	0.02 to 0.0002
Near Earth Outer Space	0.00001	0.000000002

Corrugated hose can be used under vacuum conditions and will not be overstressed under such condition, provided the hose section is adequately braced against buckling. The design approach is similar to that for internally pressurized system keeping in mind that external air pressure causes the hose to contract inwardly (rather than expand axially). The proper design though, requires evaluation of the system as a whole (not just one segment - such as corrugated hose - at a time).

Stainless Steel Hose Design

Flexibility

The flexibility of the VITALFLEX® hose is the result of the bending of the metal corrugations. Service life varies depending upon the severity of the flexing, temperature, corrosive conditions, pressure and vibration to which the hose is subjected.

Unless restrained, corrugated hose will elongate when subjected to increased internal pressure. Restraint is provided by a braided covering, consisting of a tubular sheath of woven metal wires fitted tightly over the corrugated hose and secured at each end. Bending and flexibility of the corrugated hose is not appreciably affected by the wire braid covering.

Tolerances

The nominal length refers to the hose complete with end fittings and indicates the total length. Unless otherwise arranged when ordering, the following length tolerances must be taken into account when checking the nominal length:

Dimensions in mm

Nominal Lengths	up to 500		over 500 up to	1000	over 1000 up to	2000
Tolerances	Min.	Max.	Min.	Max.	Min.	Max.
ISO 10380:2012	495	515	990	1030	1980	2060

- The "End to End" or "Seat to Seat" length of a hose assembly shall be the length as ordered to a tolerance of +3% / -1
- Smaller length tolerances are possible, but must be specially agreed when ordering.
- Refer to page 336 for hose measurement guide

Braid

Annular Braid

Style: Open pitch Material: 316 and 304 Pressure: Medium

Omega Braid

Style: Close Pitch Material: 316 and 304 Pressure: Medium

Braided Braid

Style: Open Pitch Material: 316 and 304 Pressure: High

Stainless Steel Hose Design

Flow Velocity Consideration

The flow velocity in corrugated metal hose should never exceed 150 ft/sec for gas, or 75 ft/sec for liquids. When the hose is installed in a bent condition, these flow values should be reduced proportionally to the degree of the bend. Where the flow velocity exceeds these rates, an interlocked metal hose liner is recommended. Refer to page 335 for Nomograph.

Service Life

The VITALFLEX® is engineered to provide maximum service life when properly installed. Incorrect installation, incorrect flexing or careless handling in an application will reduce the effective service life of the hose and cause premature failure of an assembly. The service life can be affected by many external factors, the environment surrounding the assembly as well as the media being transferred will together determine a general guide to the service life.

Non Destructive Pressure Testing

The nominal pressure rating of a VITALFLEX® can varies according to type, material and size. The pressure can be affected by factors such as temperature, pulsation or shock conditions and bending stresses. To avoid distortion of the convolutions of the hose, the maximum test pressure quoted in the literature must not be exceeded. If requested all hoses can be tested to 1½ times the customers stated working pressure, provided that this does not exceed the stated maximum test pressure.

Applicable Standards

If required your hoses can be manufactured for use with gas and water. Corrugated Metal Hoses: ISO 10380 AGA Approved: AS 4631 (upon request) Watermark Approved: WMTS 520 (upon request) Welding Compliant: AS 4041- Class 1 (upon request)

Seismic Rated: AS 1170 (upon request) Activfire Certified: AS 2118.1

Convolution Profile

Stainless Steel Hose - Covers and Liners

To protect the VITALFLEX® from unusual external abuse you can use different armours and covers such as: stainless steel interlock, heat shrink, lay-flat, scuff guarding, fire sleeve, fibre glass tape, PVC, rubber, wire spring-guard and rope lag cover. Refer to Cover Section Page 281 for more information

Silicone Coated Fibreglass Sleeve

Size: 6mm to 130mm Material: Silicone

Size: 20mm to 100mm

Material: 316/304 Stainless Steel, Galvanised

Size: 20mm to 100mm

Material: 316/304 Stainless Steel, Galvanised

Size: 7mm to 99mm I.D.

Material: HPDE (High Density Polyethylene)

Whipsock

Pigstail

Size: 14mm to 180mm

Material: 316/304 Stainless Steel, Galvanised

Stainless Steel Interlock Cover

Size: 3/4' - 12"

Material: 304 Stainless Steel

Layflat

Size: 20mm to 200mm I.D.

Material: PVC with low pressure stability

PVC Covering

Size: 1.6mm to 125.0mm Material: Polyolefin

Size: 6mm to 48mm Material: Sisal Rope

Hose Floats

Size: 10mm - 130mm Hose O.D.

Material: Polyethyle

Material: 316/304 Stainless Steel

Rawhide

Size: 22.9mm to 93.0mm

Material: Nylon

Ball Joint Armor

Size: 1" - 6"

Material: Stainless Steel, Galvanised

Hose Handling Sling

Size: 4" - 12" Hose Dia.

Material: 100% nylon webbing

Liners

The most common liner used in a VITALFLEX® is a metal interlock hose. The liner will allow a smooth flow rate whilst maintaining limited flexibility. The interlock will partially reduce the bend radius and inside diameter of the corrugated hose. The smooth liners reduce associated noise. Another alternative liner is braid which doesn't reduce the bend radius of the hose.

Interlock Liner

Braid Liner

Calculating Hose Length

Minimum Bend Radius Occurs at Offset Position

The moving end is free to move "out of line" from neutral position.

To find the live hose length:

$$L = \sqrt{6(RT) + T2}$$

$$Lp = \sqrt{L2 - T2}$$

Minimum Bend Radius Occurs at In Line Position

The moving end of the hose is restricted to move only up and down in line as the hose crosses neutral position.

To find the live hose length:

$$L = \sqrt{20(RT)}$$

$$Lp = \sqrt{L2 - T2}$$

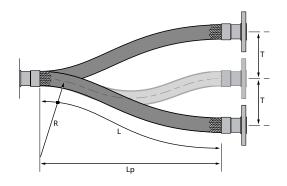

Horizontal Movable Pipe System

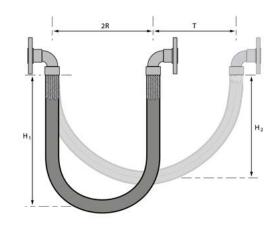

$$L = 4R + 1.57T$$

$$H1 = 1.43R + 0.79T$$

$$H2 = 1.43R + 0.5T$$

End of assembly free to move out of line from neutral position

Vertical Movable Pipe System

$$L=4R+\frac{T}{2}$$

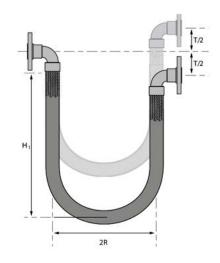

$$H_1=1.43R+\frac{T}{2}$$

L = Live Hose Length (mm)

R = Minimum Dynamic Bend Radius for Constant Flexing (mm)

T = Total Travel (mm)

H1 = Hang Length of the Loop (mm)

Installation Precautions

Prior to Installation

- **1.** Examine the hose for any obvious damage. IF THE HOSE IS DAMAGED, DO NOT USE. Examples of damage may include slices to the cover, kinks, broken braid, and crushing of the hose (can reduce life and pressure rating).
- **2.** Review application to ensure proper selection of hose has been made by examining materials, pressures, chemical compatibility, temperature and environment.
- **3.** Hose movement should be restricted to a SINGLE PLANE (Drawing A) to minimize the resultant twisting (torque). Note: The flexing plane should also be the plane in which the bending occurs. Excessive bending will induce stress fatigue (Drawing B).
- **4.** Axial movement should be eliminated. The hose should not be stretched or compressed along its longitudinal axis when installed in-line (Drawing C).

Never use hose below minimum bend radius (Drawing D). Bend radius (measured to inside radius of fluoropolymer-lined hose and centre line for the VITALFLEX®) are given for individual products and sizes (consult factory for specific data). These values represent the minimum bend radius with which the hose can be properly installed. If these values are not maintained, the hose can fail prematurely.

Note: In some cases, vacuum and pressure ratings are based on not exceeding 2% minimum bend radius (consult factory for specific hose ratings).

Do not allow severe bends (Drawing E). Severe bends can cause kinking in a hose or overstress the assembly/material, resulting in damage and ultimate failure. If severe bends cannot be avoided, use elbows designed to accommodate the direction change.

Do not twist (torque) assembly along centre line during installation. The likelihood of leakage/failure increases for hoses that are twisted (torqued) during assembly. The proper use of floating flanges and swivel-type fittings (i.e., JIC) can eliminate improper twisting.

B C WRONG movement D E

Nominal Hose Size

1/2"	1″	1 1/2"	2″	3″	4"	5″	6"
10	10	15	25	40	30	60	75

Torque (ft.-lbs.)

• For accurate tightening a torque wrench is HIGHLY recommended. If a flange leak occurs on one side of a properly torqued flange, the bolts should not be over-torqued. Instead loosen the bolts on the non-leaking side the same amount you tighten the bolts on the leaking side.

Bolt Torque Sequence

Velocity in Metal Hose

When a gas or liquid is conveyed in a VITALFLEX® assembly and it exceeds the limits, resonant vibration can occur. Resonance may cause very rapid failure of the assembly. VITALFLEX® hose should not exceed 150 ft./sec for gas applications and 75ft./sec. for liquids. High flow velocity can cause high frequency vibrations. Under such circumstances, corrugations may move from both "inside and out" as they are all connected - leading to cracks in over-stressed zones. Neither the crests nor valleys of the corrugations are protected from this kind of stress.

Flow Velocity

To avoid circumferential cracks, we have maximum recommended velocities for gas and liquid flowing through the hose. The rates are determined not only by the type of media but also by the configuration of the assembly. The following table comes to us from NAHAD Metal Design Guide, Section 5 - Liner to Handle High Media Velocity.

Maximum Recommended Flow Velocity

	Internally	Unbraided	Internally	/ Braided
Configuration	Dry Gas	Liquid	Dry Gas	Liquid
Straight	100 ft/s	50 ft/s	150 ft/s	75 ft/s
45° Bend	75 ft/s	40 ft/s	115 ft/s	60 ft/s
90° Bend	50 ft/s	25 ft/s	75 ft/s	40 ft/s
180° Bend	25 ft/s	12 ft/s	38 ft/s	19 ft/s

These recommendations come to us from NAHAD, but it is worth noting that there are other international bodies with different limits. For instance, the British Standard 6501 lists the maximum flow velocity for gas in a straight run of hose at 60 m/s, or 197 ft/sec. On the other hand, ISO 10380 lists the maximum at 30 m/s, or 98 ft/sec for gas.

Maximum Permissible Flow Rates

	G	AS	LIQ	UID
Hose ID (in.)	CFH (ft³/hour)	CFM (ft³/min.)	CFH (ft³/hour)	CFM (ft³/min.)
1/4"	283	4.72	141.5	2.36
3/8"	544.4	9.08	272.2	4.54
1/2"	923.4	15.4	461.7	7.7
3/4"	1,882.7	31.4	941.4	15.7
1"	3,309.8	55.2	1,654.9	27.6
1-1/4"	5,156.6	86	2,578.3	43
1-1/2"	8,034.6	134	4,017.3	67
2"	11,770.1	196.3	5,885.1	98.15
3"	26,482.5	441.67	13,241.3	220.835
4"	47,068.6	785	23,534.3	392.5
5"	72,911.4	1,216	36,455.7	608
6"	104,930	1,750	52,465	875
8″	179,880	3,000	89,940	1,500
10"	275,816	4,600	137,908	2,300
12"	407,728	6,800	203,864	3,400
14"	509,660	8,500	254,830	4,250
16"	689,540	11,500	344,770	5,750
18"	869,420	14,500	434,710	7,250
20"	1,079,280	18,000	539,640	9,000
22"	1,319,120	22,000	659,560	11,000
24"	1,588,940	26,500	794,470	13,250

In those applications where product velocities exceed the limits, a revision of the assembly design might include:

- 1) Addition of an interlocked metal hose liner.
- 2) An increase in the corrugated hose I.D.
- 3) A combination of the above.

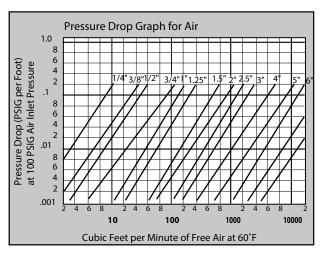

Pressure & Vibration Information

Pressure Drop

Pressure drop in a piping system is often a concern of the designer. Compared to rigid pipe, there is always a greater pressure drop in corrugated metal hose. The following graphics are offered as aids in estimating pressure drop in corrugated hose conveying water and air. The values derived are approximate and apply only to straight line installations. Bends and fittings in the hose assembly can increase the pressure drop.

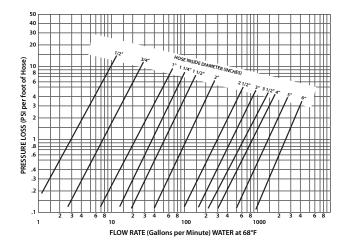

For a rough estimate, it can be assumed that the pressure loss in corrugated hoses in the turbulence zone is around 150% higher than in new welded steel pipes. I.e. the diameter of a corrugated hose would have to be increased by 20% to equal the pressure loss of steel pipe. In the high-velocity zone, corrugated hoses are around 450% higher due to the marked vortex activities; in this case, a diameter increase of 41% would be necessary.

For air inlet pressures other than 100 psig: PD = PD @ 100 psig $\left(\frac{100 + 14.7}{P + 14.7}\right)$

Water Pressure loss

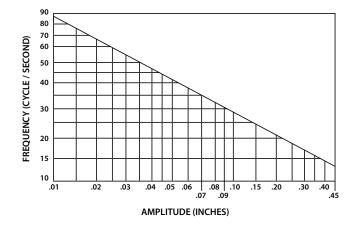

VITALFLEX® hoses are used for conveying of substances of different consistency (gaseous, liquid or solid). One of the important factors to consider in designing systems that implement metal hoses, is the loss of pressure. Due to its profile the pressure loss in corrugated hoses is significantly higher than in steel pipes - almost 100%, and about 20% to 25% higher for the stripwound hoses. To find out pressure loss over a certain length of hose we can use Pressure Loss graph below - for example: we need to calculate the pressure loss in 85 feet long 2" Corrugated Hose (which transfers water) with Flow Rate been 1400 cubic feet per hour. By using calculator below we find that 1400 ft3/hour. corresponds to 175 gal/min. Then we plot the 175 gpm on the X-axis of the chart below until we "hit" the line for 2" hose ID, then by going over horizontally to the Y-axis, we find that Pressure Loss per foot of hose will be about 3.7 psi. So that the total pressure drop over the hose length will be 314.5 psi (3.7 x 85).

Keep in mind that if you transfer gaseous substance through the hose then you need to find the ratio of the density of gas over the density of water and adjust the pressure drop respectively. For example if you transfer natural gas (density = 0.050 lb/ft3) and knowing that water density = 62.4 lb/ft3 we can find out the pressure drop as the following: 3.7 x (0.050/62.4) = 0.0030 psi/ft or 0.255 psi for entire length of hose (85 x 0.003).

Vibration information and graph

The inherent flexibility of corrugated hose plus the dampening effect of the wire braid combine to create the excellent vibration isolation qualities of corrugated metal hose. The graph below defines the combination of amplitudes and frequencies considered to be normal industrial vibration.

STAINLESS STEEL HOSE

Jacketed Hose

Vitalflex® Jacketed Hose

A Jacketed Hose assembly consists of a "hose within a hose." An inner or primary media conveying hose is enclosed or jacketed by a larger diameter hose. The hoses are joined at each end by specially designed fittings so that there is no media pathway between the two hoses.

Jacketed assemblies are often specified when the primary media must be kept at either an elevated or cryogenic temperature. Steam is often circulated through the jacket hose to keep a viscous material in the inner hose hot and easily conveyed. A vacuum can also be pulled on the jacket hose to insulate cryogenic liquids being conveyed in the inner hose.

The media typically is steam, hot oil or hot water to raise the temperature of the fluid moved in the internal hose. Also cold products such as liquid helium or nitrogen can be used to lower the temperature of the fluid with-in the internal hose.

- Heated processes
- Rail car and tank truck loading/unloading
- Marine transfer
- Flexible connections to vibrating equipment
- To relieve pump housing stresses

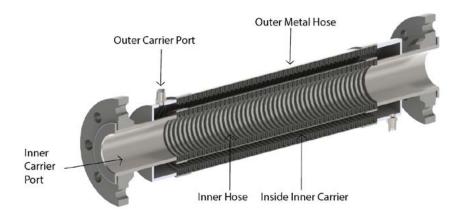

Following Applications:

• Hazardous material piping system using an alarmed vacuum jacket

The specialist hose design can also be used to contain hazardous medium in the event of a rupture. The outer hose will capture any medium that leaks from the inner hose preventing any safety or environmental issues. Sensors can be installed on the ports of the outer hoses to analyse any changes in pressure or gas detection.

- · Safety barrier for toxic processes
- Leak detection systems
- Liquified food transfer systems
- Chlorine transfer
- Cryogenics (fast freezing)

Seismic Joints

Seismic Joints and Expansion Loops

Model name: VITALFLEX-V and VITALFLEX-U

VITALFLEX® seismic joints and expansion loops are engineered to account for the cumulative movement(s) in piping systems. The VITALFLEX® joint have been designed to counter thermal expansion/contraction, offset and rotation.

Piping used in locations subject to seismic conditions have their own set of unexpected random movements. The random motion common to earthquakes, requires that seismic expansion joints be capable of movement in any direction and are able to withstand the acceleration forces.

Significant cost and safety benefits found in Pacific Hoseflex seismic expansion joints.

- It is an inexpensive alternative to dual-tied bellows expansion joints and ball joints
 Metal Hoses: ISO 10380
- During an earthquake, it protects equipment by allowing boilers, chillers, fan-coil units and other systems to move independently from buildings such as hospitals, high rises and stadiums
 Rated: AS 1170 (upon request)
- Installation at the connection point, prevents nozzles from cracking or shearing off
- A break in the gas pipe work could start a fire and cause vast damage to the entire building. This Australian Gas
 Approval (AGA) certified seismic expansion joint will compensate for the movement that occurs during any seismic
 activity such as an earthquake
 AGA Approved: AS 4631 (upon request)
- Designed for potable water applications the VITALFLEX® can be Watermark certified in accordance with WMTS 520
- Activfire Certified AS 2118.1

See Expansion Joint catalogue for data sheets Page 88

Part Number Key:

SSABC-D-E

A: Braid quality required 0 = no braid 1 = Single Braid 2 = Double Braid 3 = Triple Braid

 B:
 Tube Material
 6S = 316 Tube
 4S = 304 Tube

 C:
 Braid Material
 6S = 316 Braid
 4S = 304 Braid

D: Hose Type A = Annular, B = Braided Braid, O = Omega

E: Hose Size 06 = 1/4", 10 = 3/8", 12 = 1/2", 20 = 3/4", 25 = 1", 32 = 1 - 1/4", 40 = 1 - 1/2"

Example: SS16S4S-A-40 = 1-1/2" Single Braided Annular Stainless Steel Hose, 316 Tube and 304 Braid Example: SS26S6S-A-50 = 2" Double Braided Annular Stainless Steel Hose, 316 Tube and 316 Braid

VITALFLEX® - Omega / Braided Braid

mmm

Omega Part No.: SS0-O Tube Only / SS1-O Tube and Single Braid / SS2-O Tube and Double Braid **Braided Braid Part No.:** SS0-B Tube Only / SS1-B Tube and Single Braid / SS2-B Tube and Double Braid

Construction: Omega / Close Pitch **Tube Available:** 304 / 316 Stainless Steel **Braid Available:** 304 / 316 Stainless Steel

Size Available: 5" - 20" (Larger sizes upon Request)

Max Temp: -276°C to 700°C

Construction

Vibration Eliminator / Pump Connector

Pump Connectors are flexible metal assemblies, primarily designed to isolate vibration from pumps on both the suction and discharge sides of the pump. They help to prevent damage caused by vibration, expansion and contraction. They accept thermal expansion and reduce piping stress due to minor misalignment. Constructed of stainless steel Omega corrugated metal and surrounded with a woven braid of high tensile stainless steel, these assemblies are flexible and are suitable to withstand high pressure and temperatures.

Corrugated Metal Hoses: ISO 10380 AGA Approved: AS 4631 (upon request) Watermark Approved: WMTS 520 (upon request) Welding Compliant: AS 4041- Class 1(upon request) Seismic Rated: AS 1170 (upon request) Activfire Certified: AS 2118.1 (upon request)

	Higher pressure hoses can be designed on request														

All parts come in contact with Oxygen of stainless steel are remain oil and grease free. An additional mechanical protection can be achieved by use of an outer interlock profile hose. Inner liner (interlock hose) is predominantly used for the oxygen supply to improve the flow condition and reducer the pressure loss.

Application:

In steel production, the pig iron produced in a blast furnace, and oxygen is lanced onto this molten iron at regular intervals. This encourage combustion of excess carbon and part of unwanted companion elements.

The movements of lance hose over several meters in a vertical as well as a horizontal direction is made possible by flexible lance hose which are installed in 180 degree bend position (also know as a travelling loop).

STAINLESS STEEL INTERLOCK

Stripwound Hose

Light Weight Engine Exhaust Interlock

Part No.: EEI4S

Construction: Unpacked

Profile: Medium Flexibility / Medium Pressure

Tube Available: 304 Stainless Steel

Size Available: 3/4" - 12" (Larger sizes upon Request)

Max Temp: 700°C

Lengths: Min 3mtrs, supplied in 3mtr increments

Construction

Typical applications include commercial vehicle, passenger vehicle plus plant and portable generator set exhaust systems. This is a general purpose flexible metallic light weight conduit designed for a variety of installations requiring motion, vibration and bending.

STAINLESS STEEL INTERLOCK

Stripwound Hose

Material Handling Lined Interlock

Part No.: MHI4S

Construction: Unpacked / Liner

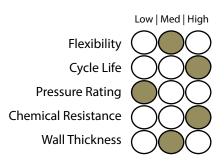

Profile: Medium Flexibility / Medium Pressure

Tube Available: 304 Stainless Steel

Size Available: 1 1/4' - 10" (Larger sizes upon Request)

Max Temp: 700°C

Lengths: Min 3mtrs, supplied in 3mtr increments

Construction

The interlock is specially wound into a double interlock hose from two separate metal strips. The double interlock hose is manufactured for the purpose of producing a liner to create a moderately smooth inner bore. The inner will provide a higher flow rate giving the hose a variety of advantages such as nil air loss from its tighter construction, elimination of materials degradation and contamination experienced with other hoses, as well as a longer service life due to greater abrasion resistance.

Applications may include large volume transfer of dry bulk materials, difficult to fluidize materials in industrial plants, ships, barges, silos, elevators, trucks and rail units. Uses include pneumatic transfer of bulk materials in powder, pellet, granules, flake or pebble form such as chemicals, feed, flour, grain, plastics, sugar, cement, pebble and lime.

Applications

Vacuum Jacketed Hoses

These maintenance-free and durable cryogenic transfer lines are designed for use with cryogenic liquids and gases. Even with the extremely low temperatures below -150°C flowing through the hose, the outer surface remains at room temperature, ensuring safety when touched with bare hands. The reduced liquid and gas consumption of these hoses translates to cost savings for your business.

Vitalflex Vacuum Jacketed (VVJ) hoses incorporate cuttingedge super insulation technology, guaranteeing optimal thermal efficiency. VVJ products come in two options for vacuum insulation: static and dynamic vacuum types.

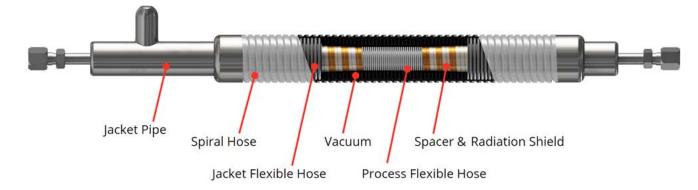

Thanks to the coaxial bellow construction, these hoses offer exceptional flexibility, allowing for easy manoeuvrability. Additionally, the use of lightweight stainless steel materials minimizes cool-down loss to an absolute minimum. To further protect the vacuum jacketed hoses, they are encased in a stainless steel spiral wrap or a braided outer cover, ensuring durability and longevity.

On top of that, (VVJ) conditioning equipment comes with advanced close tolerance bayonet connections that guarantee frost and condensation-free operation, with the lowest heat leaks, preserving your cryogenic fluid at the lowest temperature and ensuring pressure stability. Vacuum Jacketed Transfer hoses are the epitome of thermal efficiency in transfer hoses, designed specifically to minimize and reduce loss of containment during operation.

Our lightweight inner tubing significantly reduces cooldown losses, enabling rapid hose cooldown and accelerating the delivery of cryogenic liquid to the desired point of use.

By utilizing our Vacuum Jacketed Transfer Hose, you can expect higher quality liquid with lower gas content at the point of use, thereby enhancing equipment efficiency.

- Ranging from semi-flexible to ultra-flexible to suit your type of application
- Hazardous ice & dripping water is reduced or eliminated, increasing safety.
- Outer surface is safe to the touch, even when used with liquid hydrogen or liquid helium.
- Interlocking stainless steel cover provides a light weight, durable, and flexible product.
- Each transfer hose is flow and leak tested to ensure superior quality.
- Standard lengths and end fittings are maintained in-stock for quick delivery.
- Custom configurations are also available.

Options & Accessories

- Integrated vacuum jacketed tees and elbows
- · Bayonet connections
- Vacuum jacketed shut-off valves
- Pressure relief valve assemblies
- Sintered metal diffusers (phase separators)
- High pressure ratings available upon request

Applications

- · Electronic and Semiconductor
- Medical and Pharmaceutical
- · Laboratory and Biotechnology
- Food and Beverage
- Aerospace
- Industrial

Mediums

- Hydrogen
- Helium
- Nitrogen
- Argon
- Oxygen
- Methane
- Propane

Vitalflex Vacuum Jacketed (VVJ) VJ-Flex Hose Application Benefits

Reusability

Pre-engineered modular concept allows the vacuum insulated transfer hose to be easily reuse if use-point locations and plant layout is changed

Cost Saving

This option provides simplicity and cost saving as it reduces the necessity for precise system layout measurements

Time Saving

Readily available on the shelf for fast delivery, thus reduces material lead time for your cryogenic piping project

Vacuum Jacketed Hoses

Vitalflex Vacuum Jacketed (VVJ) provide transfer hoses with various flexibility to suit different piping needs and applications. All hoses comes with static vacuum as standard and dynamic vacuum as option. Static vacuum hose is vacuum sealed at the factory, providing many years of trouble free vacuum insulation. All hoses comes with high quality wear resistant stainless steel outer braid or kink resistant spiral wrap protection cover.

Vacuum Jacketed Semi (VVJS)

Pre-engineered modular vacuum insulated Vitalflex Vacuum Jacketed (VVJ) hose has added advantage over the traditional hoses, especially when piping system reconfiguration is frequently done. Vacuum jacketed hose can be added if required to the existing system without major rework expenses.

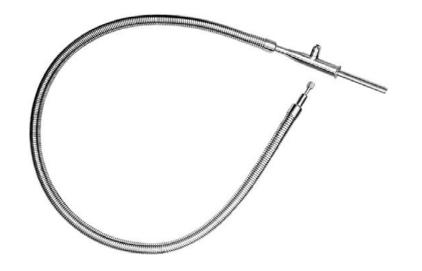

Vacuum Jacketed Cryo (VVJC)

Flexible transfer hose mainly used to overcome misalignment in rigid piping system; and as a final tie-in from rigid piping to equipment such as bulk tank & process equipment.

VITALFLEX® - Vacuum Jacketed Ultra (VVJU)

Offers high flexibility, sturdy & kink-resistant spiral wrap outer jacket, suitable for rough handling usage such as cryogenic liquid cylinder (LGC / dewar) refilling; and liquid withdrawal from pressurized dewar to test handler.

VITALFLEX® - Vacuum Jacketed Semi (VVJS)

Construction: SS1-A Tube and Single Braid / SS2-A Tube and Double Braid

Profile: Annular / Close Pitch

Tube Available: 300 / 304 / 316 Stainless Steel / **Cover options:** 300 / 304 / 316 Stainless Steel /

Size Available: 5/8" - 2" (Larger sizes upon Request)

Max Temp: -196°C to 700°C

Cycle Life Pressure Rating Chemical Resistance Wall Thickness

Construction

Vacuum Jacketed Semi (VVJS) is a semi-rigid bendable pipe with optimal flexibility is suitable for long distance piping system application, an alternative to traditional rigid piping. It's lightweight stainless steel construction reduces cool-down losses to an absolute minimum.

The VVJS hoses are protected by a high quality and wear resistant stainless steel braided outer covering. Typical hoses are manufactured with pipe thread ends or bayonet connection.

These hoses are used in a wide variety of applications as main transfer hose for LN2 such as food freezing, semiconductor test handlers, MBE and LN2 dosing applications.

Specifications

Part Number	Inner Dia (mm)	Outer Dia (mm)	"Steady State Heat Leak (watts/hr)"	"Bayonet heat leak (watts)"	Bend Radius (mm)	Working Pressure (kPa)
VVJS-16	16.2	52.1	1.3	1.2	300	1380
VVJS-25	25.1	62.8	1.4	2.4	400	1380
VVJS-32	34.2	81.2	1.5	2.4	450	1380
VVSJ-40	40	120	1.7	2.7	600	1380
VVSJ-50	50.1	120	1.6	3.3	720	1380

Optional manufacturing options: Pneumatic pressure test, Vacuum retention testing, LN2 cold shock, pre-material certs., X-ray, ASME B31.3 certification, CFOS cleaning for O2 services

End couplings available: Bayonet, threaded, flanged

VITALFLEX® - Vacuum Jacketed Cryo (VVJC)

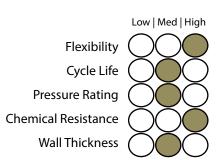

Construction: SS1-A Tube and Single Braid / SS2-A Tube and Double Braid

Profile: Annular / Close Pitch

Tube Available: 300 / 304 / 316 Stainless Steel / **Cover options:** 300 / 304 / 316 Stainless Steel /

Size Available: 5/8" - 2" (Larger sizes upon Request)

Max Temp: -196°C to 700°C

Construction

Vacuum Jacketed Cryo (VVJC) hoses are a vacuum insulated stainless steel flexible hose designed to meet high flow capacity without compromising its flexibility. Engineered as modular section with close tolerance bayonet connections. It can be used on its own, or as part of StatiRigid sections for misalignment offset. VVJC pipe is evacuated and sealed at the factory as a static vacuum and is available in dynamic vacuum. VVJC are available in wide variety of sizes from DN16 up to DN50 to meet most the standard or custom requirements.

Vitalflex Vacuum Jacketed (VVJC) offers a complete line of components such as inline venting devices, phase separators and gas traps to maximize the system performance. VVJC is used in a wide variety of applications including biotech, cryogenic storage, food and beverage, nanotech, environmental temperature chambers and R&D applications.

Low | Med | High Flexibility Cycle Life Pressure Rating Chemical Resistance Wall Thickness

Construction

Ultra-Flex transfer hose is a ultra-flexible, vacuum insulated LN2 transfer hose with high flexibility. It has the lowest dynamic bend radius among all cryogenic hoses in the market. Due to its lightweight stainless steel construction, cool-down loss can be reduced to an absolute minimum.

Ultra-Flex hoses are protected by a tough and antikink stainless steel spiral wrap outer covering, its non wire braid prevent potential operator injury due to sharp wire found in traditional braided sleeve. Typical hoses are manufactured with pipe thread ends or female flare 1/2" JIC/CGA fittings or C5 bayonet.

These hoses are used in a wide variety of applications including tool connections with portable dewars supplying LN2 to test handlers, LN2 doser, or any moving reservoirs and custom OEM applications.

Specifications

Stainless Steel Hose

Vacuum Jacketed Pipes (VJP)

Construction: Coaxial stainless steel pipe

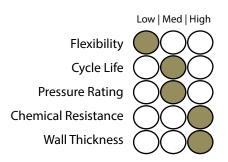

Profile: Combination smooth inner pipe with convoluted bellow

Tube Available: 304 / 316 Stainless Steel

Cover options: Radiation Shield

Size Available: 3/4" - 3"

(Larger sizes upon Request)

Construction

Engineered as modular sections, these stainless steel coaxial vacuum insulated piping spools are joined together with close tolerance bayonet connections, forming a complete cryogenic transfer system. Each section is evacuated, sealed and tested for vacuum integrity to ensure minimal heat gain.

Vacuum Jacketed Pipes (VJP) come with internal bellows at required intervals to serve as thermal expansion compensators according to EJMA calculation. The pipe comes with smooth inner bore to minimize pressure drop and improve flow characteristics. Installation for VJP can be done easily both indoor and outdoor, by incorporating flexible sections strategically to offset misalignments. VJP offers a complete line of components including in-line venting devices, phase separators and gas traps to maximize the cryogenic system performance.

Specifications

Part Number	Inner pipe Dia (mm)	Outer Jacket Pipe Dia (mm)	Actual internal flow Dia (mm)	Hole Required to Accommodate Pump Out (mm)	Bayonet Clamp OD (mm)
VJP-5T	19.05	60.3	16.6	100	51
